

Perfect. That gives us a clear scope.

Final Requirements Captured

-  **Architecture:** Page Object Model + Page Factory
-  **Execution:** Fully configurable (Sequential, Method, Class, Suite)
-  **Data Sources:** Excel, JSON, CSV, Properties, Database
-  **Configuration:** Configuration files only
-  **Reporting:** Extent Reports
-  **Locator Strategy:** Self-healing ready
-  **Framework Capability:** Enterprise + AI Ready
-  **Scope:** Generic Web Automation Framework

These requirements are sufficient to begin designing the framework. In the next phase, I'll:

1. Summarize your chosen requirements.
2. Explain the overall architecture and design decisions.
3. Propose the complete enterprise-grade project structure.
4. Implement the framework step by step with well-commented Java code.
5. Explain the rationale behind every design decision and discuss alternatives.
6. Follow industry best practices for Selenium, Java, TestNG, Maven, Page Object Model, and data-driven testing.

We'll build it as a reusable, scalable framework suitable for enterprise projects while keeping it generic enough to automate any web application.
